DARSim Example:

CCS with Unstructured Mesh

This example demonstrates how to use an unstructured mesh with DARSim, including pEDFM. The mesh is generated with GMSH and exported to a .m file format (called `res_mesh.m`). The mesh file is read by `unstructured_mesh.m` to be used in the DARSim simulator.

To define the unstructured mesh, the simulation input file (called `Sim.txt`) uses:

```
GRID_DISCRETIZATION
        UnstructuredGrid
        unstructured_mesh.m
```

This makes the grid definition in `DIMENSION` and `SPECGRID` irrelevant (but note that they are still required input parameters by the simulator).

This example also plots the mesh interfaces by using the parameter `PLOT_INTERFACES` (set to 1) in the `SimulatorSettings.txt` file.
